2005

Jan. 15 - General Meeting – Details TBA

March 5 – General Meeting – Details TBA

April 23 – Annual Celiac Walk

May 21- General Meeting— Details TBA

The July 3, 2004, issue of *Science News* contains a summary of a study by Israeli doctors linking neurological problems with Celiac disease. Researchers examined 111 children treated for CD between 1977 and 2001 and used 211 healthy (non-CD) children as controls.

The doctors identified neurological problems in 51 percent of the children

with CD and in only 20 percent of the healthy children. These neurological problems included epilepsy, migraines and reduced muscle control. The research team also reported a new link between CD and attention deficit and attention deficit/hyperactivity disorders.

Some people with CD only develop the neurological symptoms and do not have the classic gastrointestinal problems. However, until doctors learn to recognize all signs of this condition, more cases in children will go undiagnosed or treated with harmful and/or ineffective drugs.
